

Option valuation

Binomial method

1

Option valuation

□ Context:

- Many standard and nonstandard options do not have valuation formulas (e.g., American-style options).
- To value option and measure risk, use approximation methods.
 - Binomial method
 - Trinomial method
 - Quadratic approximation method
 - Finite difference method

2

Option valuation

- Purpose:
 - Develop and apply binomial method.
 - Simplest to understand.
 - Broad-ranging applications.

3

Binomial method

- Illustration parameters:
 - Consider FX option.
 - Current exchange rate is 50.
 - Domestic interest rate is 5%.
 - Foreign interest rate is 2%.
 - Volatility rate is 20%.
 - Value American-style put option on foreign currency with 55 exercise price and 2-year time to expiration.

4

Binomial method

- Step 1: Create asset price lattice.
 - Assume underlying asset price has discrete proportional jumps through option's life.
 - $u (>1)$ is up-step coefficient and $d (<1)$ is down-step coefficient, with $ud = 1$.

$$\begin{array}{ccc}
 & & uuS \\
 & uS & \\
 S & & udS \\
 & dS & \\
 & & ddS
 \end{array}$$

5

Binomial method

- Decide on length of time increment.

$$\begin{array}{ccc}
 & & uuS \\
 & uS & \\
 S & & udS \\
 & dS & \\
 & & ddS
 \end{array}$$

6

Binomial method

□ Set time increment to one year.

$\leftarrow 1 \text{ year } \rightarrow$

		uuS
	uS	
S		udS
	dS	
		ddS

7

Binomial method

□ Set time increment to one year.

$\leftarrow 1 \text{ year } \rightarrow$

		uuS
	uS	
S		udS
	dS	
		ddS

8

Binomial method

- Compute up-step and down-step coefficients. Up-step coefficient is defined as:

$$u = e^{\sigma\sqrt{\Delta t}}$$

↑
User-defined time increment.

9

Binomial method

- Compute up-step and down-step coefficients. Up-step coefficient is defined as:

$$u = e^{\sigma\sqrt{\Delta t}}$$

↑
Standard deviation of asset return.

10

Binomial method

- Compute up-step and down-step coefficients. Up-step coefficient is defined as:

$$u = e^{\sigma\sqrt{\Delta t}} \quad d = \frac{1}{u}$$

Down-step coefficient is reciprocal of up-step coefficient, i.e., tree recombines.

11

Binomial method

- Compute up-step and down-step coefficients.

$$u = e^{.20\sqrt{1}} = 1.2214$$

$$d = \frac{1}{1.2214} = .8187$$

12

Binomial method

- Complete asset price lattice.
 - Possible asset price paths during option's life:

		<i>uuS</i>
	1.2214(50)	
50		<i>udS</i>
	.8187(50)	
		<i>ddS</i>

13

Binomial method

- Complete asset price lattice.
 - Possible asset price paths during option's life:

		74.59
	61.07	
50		50
	40.94	
		33.52

14

Binomial method

- Step 2: Value option at expiration.
 - American-style put with $X = 55$.

$$\max(0, 55 - 74.59) = 0$$

$$\max(0, 55 - 50) = 5$$

$$21.48$$

15

Binomial method

- Value option at expiration.
 - American-style put with $X = 55$.

$$0$$

$$5$$

$$\max(0, 55 - 33.52) = 21.48$$

16

Binomial method

- Step 3: Value option one step back in time by taking present value of expected future value.

17

Binomial method

- Probabilities are identified by equating expressions for expected asset price.

$$Se^{b\Delta t} = puS + (1-p)dS$$

↑
 Expected asset price based on
 expected rate of price appreciation and
 log-normal price distribution.

18

Binomial method

- Probabilities are identified by equating expressions for expected asset price.

$$Se^{b\Delta t} = \underbrace{puS + (1-p)dS}$$

Expected asset price based on binomial distribution.

19

Binomial method

- Probabilities are identified by equating the expressions for expected asset price.

$$Se^{b\Delta t} = puS + (1-p)dS$$

$$\Rightarrow p = \frac{e^{b\Delta t} - d}{u - d}$$

20

Binomial method

- Assume cost of carry rate is $5\% - 2\% = 3\%$.

$$e^{.03(1)} = 1.0305$$

$$p = \frac{1.0305 - .8187}{1.2214 - .8187} = .5258$$

21

Binomial method

- Value option one step back in time by taking present value of expected future value.

22

Binomial method

- Expected future value (*EFV*) is:

$$EFV = .5258(0) + .4742(5) = 2.37.$$

- Present value (*PV*) of *EFV* is:

$$PV = e^{-r\Delta t} (2.37) = e^{-.05(1)} (2.37) = 2.26.$$

23

Binomial method

- Substitute value into lattice.

24

Binomial method

- Compute PV at lower node.

25

Binomial method

- Compute PV at lower node.

26

Binomial method

- Current value is for European-style put.
 - Did not account for early exercise.
 - BSM formula (correct) value is 6.40.

			0
		2.26	
6.63			5
		12.19	
			21.48

27

Binomial method

- Step 3a: Check if early exercise is optimal at each node.

What is early exercise value here? →

			0
		2.26	
?			5
		12.19	
			21.48

28

Binomial method

□ Check if early exercise is optimal.

$55 - 61.07 = -6.07$. No early exercise.	0
?	2.26
	5
	12.19
	21.48

29

Binomial method

□ Check if early exercise is optimal.

What is early exercise value here?	0
?	2.26
	5
	12.19
	21.48

30

Binomial method

□ Check if early exercise is optimal.

$55 - 40.94 = 14.06$.	Optimal to exercise.	0
?	2.26	5
	12.19	21.48

31

Binomial method

□ Check if early exercise is optimal.

$55 - 40.94 = 14.06$.	Optimal to exercise.	0
Replace.	2.26	5
?	14.06	21.48

32

Binomial method

- Continue iterative process.

		0
	2.26	
7.47		5
	14.06	
		21.48

33

Binomial method

- Value of early exercise premium is:

$$7.47 - 6.63 = .84$$

34

Binomial method

- Illustration: Nonstandard option valuation.
 - Up-and-out put is put that expires worthless if asset price touches or crosses up-and-out level (i.e., the “knock-out” barrier) any time during option’s life.
 - Also called barrier option.
 - Traded in OTC market.
 - Assume put option is American-style and has knock-out barrier of 60.
 - Ceases to exist if exchange rate hits 60.

35

Binomial method

- To value up-and-out put simply modify valuation checks at each node.
 - Check for early condition as before.
 - Check “knock-out” condition.

36

Binomial method

□ Check if early exercise is optimal.

What is early exercise value here? 0

↘ 2.26

?

12.19

5

21.48

37

Binomial method

□ Check if early exercise is optimal.

$55 - 61.07 = -6.07$. No early exercise. 0

↘ 2.26

?

12.19

5

	21.48

43

Binomial method

□ Check if early exercise is optimal.

Is put “knocked out”?	0
?	0
	5
	21.48

44

Binomial method

□ Check if early exercise is optimal.

$40.94 < 60$. No “knock out.”	0	
	0	
?	14.06	5
		21.48

45

Binomial method

□ Value of American-style, up-and-out put is:

		0
	0	
6.34	14.06	5
		21.48

46

Binomial method

- Value of knock-out feature is:

$$7.47 - 6.34 = 1.13$$

47

Binomial method

- Steps of binomial method.
 - 1. Create asset price lattice.
 - 2. Value option at expiration.
 - 3. Step back one time increment and take present value of expected future option value.
 - a. Check boundary conditions.

48

Binomial method

- Coefficients and probabilities used in lattice are not unique.
 - Cox, Ross, and Rubinstein (1979) simplification (Method 3)

$$u = e^{\sigma\sqrt{\Delta t}} \quad d = \frac{1}{u}$$

$$p = \frac{e^{b\Delta t} - d}{u - d}$$

49

Binomial method

- Coefficients and probabilities used in lattice are not unique.
 - CRR (1979) correct version (Method 1)

$$u = e^{\sigma\sqrt{\Delta t}} \quad d = \frac{1}{u}$$

$$p = \frac{1}{2} + \frac{1}{2} \left(\frac{b - .5\sigma^2}{\sigma} \right) \sqrt{\Delta t}$$

50

Binomial method

□ OPTVAL function

51

Binomial method

□ Supporting file: Binomial method.xlsx

52

Binomial method

- Coefficients and probabilities used in lattice are not unique.
 - JR (1983) (Method 2)

$$u = e^{(b-.5\sigma^2)\Delta t + \sigma\sqrt{\Delta t}} \quad d = e^{(b-.5\sigma^2)\Delta t - \sigma\sqrt{\Delta t}}$$

$$p = \frac{1}{2}$$

53

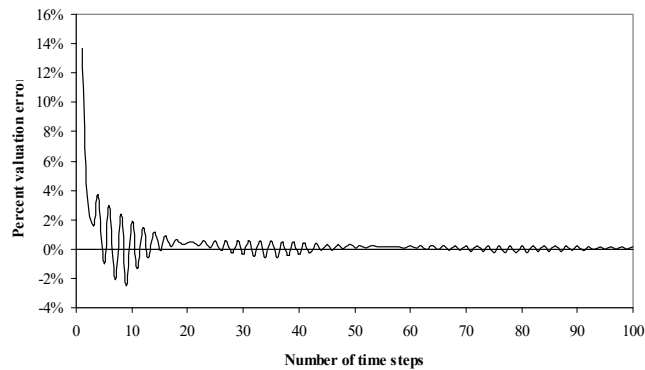

Binomial method

- Qualifications on use.
 - Cruder grid, greater error.
 - More refined grid, greater computational cost.
 - Flexible.
 - Easily adapted to handle other types of contingent claims.

54

Binomial method

- Percent approximation error.

55

Lesson summary

- Many standard and nonstandard options do not have analytical valuations equations (e.g., American-style options).
- Can be valued accurately using approximation methods.
- Develop and apply binomial method.

56
